

HOUSEHOLD ITEMS

WHAT YOU NEED TO KNOW

What are they?

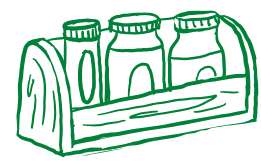

Household items can be hazards

Common household items can be psychoactive, meaning they affect the mind and can change mood or perception. Accidental ingestion may occur when these items are used outside the guidelines for intended use, whether from dares, popular internet challenges, or mistaking a product for something else.

Many of these household items have a variety of chemicals that can be toxic. It is important to know the risks of inhaling, ingesting, or even getting these chemicals on the skin.

Examples of Household Items

- Laundry detergent pods (Tide Pods) 
- Cough syrups, anti-nausea or allergy medications 
- Aerosols (hairspray, whipped cream, air fresheners) 
- Mouthwash and hand sanitizer 
- Cooking spices (e.g. nutmeg, cinnamon, and saffron) 
- Craft supplies (glue, paint, markers, and white-out) 
- Gasoline 
- Helium balloons 

How are they used?

Household items can be sniffed, ingested orally, or inhaled.

What are the effects?

In general, all household items have the potential to cause stomach upset, organ damage, and even death, when misused.

Ingesting household cleaners can cause severe stomach upset, difficulty breathing, and seizures- even if it is quickly spit out.

Some medications cause euphoria, but they can also cause unconsciousness and breathing difficulties.

Spices like nutmeg and cinnamon can cause hallucinations, psychosis, a rapid heart rate, and choking in large amounts.

HOUSEHOLD ITEMS

When do you seek emergency help?

Overdose or poisoning: Taking too much of a substance, or combining substances together.

Signs: Unconsciousness, difficulty walking, speaking, or seeing, gasping for air or not breathing, and vomiting or diarrhea that is not stopping.

Get help right away! Call **911** or Health Canada's poison control at **1-844-764-7669**, and **check the product label** for first aid directions.

Did you know?

Accidental poisonings is the **3rd leading cause** of unintentional injuries requiring hospitalization for children aged 14 and under in Canada.

Around 4,000 Canadians die each year from poisonings.

How to stay safer

1

Not using household items is the safest choice, though it may not be realistic for everyone.

2

Know who to contact! Keep the national poison control line in your phone or nearby if you're using a household item.

3

Store safely! Keep household chemicals away from the reach of young children. Make sure items are stored in their original labelled containers.

4

Timing matters: Don't use household items before **work, school, or driving**. It affects concentration and reaction time.

5

Moderate use. Regular use can affect your health and relationships with others.

6

Don't mix! Household items can react with other substances, increasing the risk of serious side effects like organ damage and poisoning.

7

Don't use alone. Have a friend with you in case you need help.

Follow the label!

After taking a harmful chemical, many people try to vomit. This **doesn't always work** and may even cause **further injury!**

The label on household items usually has first aid directions, including whether or not to induce vomiting.

Always follow these directions and be sure to **bring the container with you** when you go for help.
