What are the effects?

The effects of psilocybin is commonly called going on a "trip".

Psilocybin hallucinations can cause a loss of reality. This increases the risk of accidental injury.

The type of trip depends on many factors, such as mood, environment, mental illness, and taking other drugs.

Psilocybin can cause an increased heart rate and blood pressure. This can lead to cardiac arrest.

Psilocybin can cause strong auditory and visual hallucinations. This can increase creativity, but can also cause intense anxiety.

Sometimes flashbacks from past psilocybin trips can occur- even when sober.

Tips for Bad Trips

Start low and go slow. Large doses are a frequent cause of a bad trip

Mind your mood. Psilocybin can intensify feelings of anxiety and sadness. Use it when you're happy and relaxed!

Have a "trip sitter". A "trip sitter" is a sober person who can help guide you through any intense feelings you may have during a trip.

If you're having a bad trip, move to a calm environment and think about how this feeling will pass. Practise deep breathing.

How to stay safer

- 1 **Avoiding psilocybin use** is the best way to stay safe, but that may not be realistic for everybody.
- 2 **Don't mix!** Mixing psilocybin with other substances can greatly increase your risk of serious side effects- including bad trips.
- 3 **Plan for safety.** Have a ride arranged for after you use mushrooms. Bring condoms if sex is a possibility.
- 4 **Know your risk factors!** Psilocybin can induce or worsen symptoms (e.g. mania, psychosis) of psychiatric conditions. A family history of psychiatric illness puts you at a higher risk.
- 5 **Moderate use.** Regular use can affect your health and relationships with others. It can lead to frequent, intense flashbacks.
- 6 **Know your mushrooms.** Magic mushrooms can look very similar to fatal mushrooms.
- 7 **Use in a familiar area.** This lowers the risk of accidental injury and anxiety!
